

RVI and OS V7r1 and r2

#

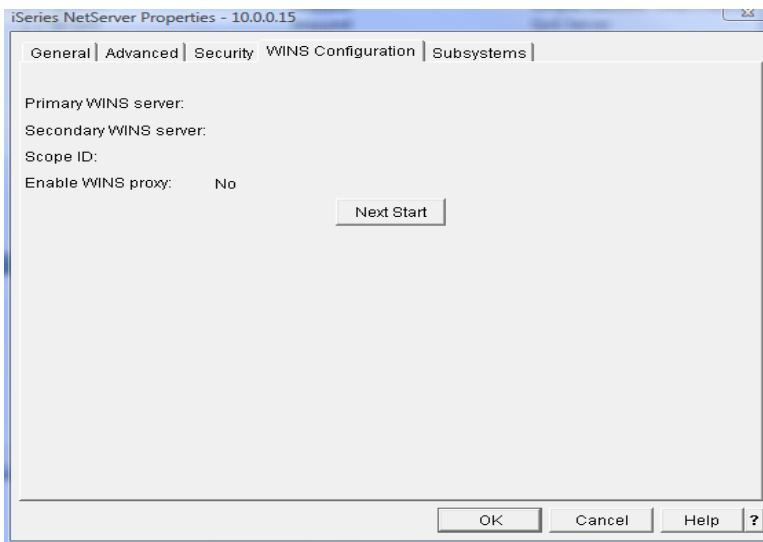

After their upgrade to OS V7r1 or r2, some RVI customers were experiencing a problem with their symbolic link ... they could not see anything under it. The fix turned out to be an entry in the Primary and Secondary Win server name. According to IBM there should not be anything there. Remove the entries by clicking on Next Start. Once removed, end the server and restart.

See the screen shots below to navigate to the properties:

Highlight iSeries NetServer and click Properties. Then click WNS Configuration to see the next screen.

Note: There are no RVI license fees involved with an iSeries operating system upgrade.
